

1) Which field of the Customers table is the primary key?

->Cnam field is a primary key in the customers table

2) What is the 4th column of the Customers table?

->select * from customers

Where 4;

3) What is another word for row? For column?

->TUPLE

4) Why isn't it possible to see the first five rows of a table

-> In an RDBMS, seeing the "first five rows" of a table is challenging because:

Fragmented Storage: RDBMSs often store rows in a fragmented manner across the storage space to optimize performance and handle multiple transactions efficiently. This means rows aren't stored sequentially.

No Inherent Order: Unlike some DBMSs, RDBMSs don't maintain an inherent order of rows. The physical storage of rows doesn't reflect the order they are queried or displayed in.

Querying for Specific Rows: To view a specific subset of rows, such as the first five, you need to use SQL clauses like LIMIT in MySQL or TOP in SQL Server to explicitly request this subset
